

3rd November 2010

NEW RESULTS EXTEND SIZE OF MUTIARA PROSPECT IN ACEH

Highlights:

- Mutiara Prospect extended to the east with new gold and copper results from trenching and surface sampling.
- Mutiara now extended to 1 kilometre long by 1.3 kilometres wide.
- Field work commenced on several new potential porphyry and high grade skarn mineralised targets identified from recent helicopter borne magnetic survey.
- First ever drilling imminent at Panton Luas

Prosperity Resources Limited (ASX: PSP) is pleased to announce further gold and copper results from Mutiara East. The Mutiara Prospect is located 1.5 kilometres to the north west of the Panton Luas Prospect and these results support the interpreted continuity of mineralisation and alteration between the two exciting Prospects.

The first ever drilling at Panton Luas has started using a man portable diamond drilling rig from Drillcorp. The first assays from the drilling are expected in around three to four weeks time. Drilling is also planned for the Mutiara Prospect in the current drill program. Three other targets are drill-ready and additional rigs are expected to commence in November.

Chairman Mr. Mo Munshi stated “extension of existing Prospects such as Mutiara and the discovery on new target areas is highlighting the potential for multiple discoveries of significant size. While exploration at our Aceh gold/copper project is still at a relatively early stage, results generated to date continue to increase confidence regarding the prospectivity of this underexplored region.”

Mutiara East Trench and Surface Samples

Mutiara East Sampling

New rock chip results from additional sampling have been received from Mutiara East. The sample results are considered significant as they lie in a previously unassessed catchment between the Panton Luas and Mutiara Prospects, at about 200m from Mutiara and 1.2 kilometres from Panton Luas. The better of the gold and copper results are from narrow magnetite skarn hosted bodies within weak regional alteration. However an as yet poorly defined zone of texturally destructive pyritic alteration (bleaching silica/ carbonate-pyrite alteration appearing in the east), up to 200m metres wide is also anomalous, and could provide a link between alteration styles seen at the more advanced Prospects of Mutiara and Panton Luas. The Mutiara Prospect has now been extended to 1 kilometre in strike length with a width of 1.3 kilometres.

Competent Person Statement

Information in this announcement that relates to Exploration Results is based on information compiled by Michael Ivey, Principal of M Ivey Pty Ltd trading as MetalsEx Capital, who is a Member of The Australasian Institute of Mining and Metallurgy. Michael Ivey is a permanent employee of MetalsEx Capital and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 JORC Code. Michael Ivey consents to the inclusion in the announcement of the matters based on the information in the form and context in which it appears.

**ACEH PROJECT
TRENCH SAMPLING RESULTS - SIGNIFICANT INTERCEPTS
MUTIARA PROSPECT**

Trench No	Prospect	Start Easting	Start Northing	Interval	From	Au (g/t)	Cu(%)
M27	Mutiara	291346	377791	6m	0	0.43	0.2
M28	Mutiara	291351	377883	18m	0	0.15	0.12

Grid Coordinates WGS84 Zone 47 North.

Trench samples taken at 3 metre intervals.

Surface samples with values of greater than 800 ppm Cu shown

Gold analysis was undertaken by Intertek Jakarta by fire assay analysis. Copper was analysed by ICP following acid digest.
